APPARATUS, SYSTEM, AND METHOD FOR AUTOMATION USING AUTOMATION MODULES

ABSTRACT

5

10

A system, apparatus and method for performing automation is disclosed. An apparatus configured to control an automation function includes one or more automation modules connectable into an assembly. The automation modules include a data interface for exchanging data with other automation modules and a processor coupled to the data interface. A functional component is operable by the processor for performing an independent automation task. The data interfaces of the automation modules are coupled to exchange data communications for coordinating the respective functional components of the automation modules to perform the automation function.
